

INSTALLATION & SETUP GUIDE

The Rødspætte Danish-vocabulary system

A Chrome extension that captures words as you read — enriching them with ordnet.dk data and free on-device translation — and an installable quiz app that studies them with spaced repetition. Both read and write the same Excel files in your own private GitHub repository. That repo is the single source of truth, and nothing is sent anywhere else.

WHAT'S IN THE PACKAGE

extension/ — the Chrome extension: word capture, ordnet.dk lookups, free on-device translation, a known-words highlighter and a built-in PDF reader.

quiz-app/ — the installable flashcard app (FSRS spaced repetition), hosted for free on GitHub Pages.

LICENSE, and this guide.

BEFORE YOU START

A GitHub account, and a **private repository** to hold your vocabulary (for example dansk-vokab). Sets live in a **sets/** folder, created on first save.

A **fine-grained personal access token** with Contents: Read and write on that one repository. The same token works for both parts.

Chrome 138+ on desktop, for the free built-in translator (optional, recommended).

01 Install the Chrome extension

1. Open `chrome://extensions` and turn on **Developer mode** (top-right).
 2. Click **Load unpacked** and select the extension/ folder. The card should read Rødspætte 1.1.0. Pin it for easy access. (*Updating from 1.0? Just replace the folder contents and press ↻ Reload on the card.*)
 3. Open the extension's **Options**. Enter your token, owner (your username), repo, and folder (sets). Click **Save settings**, then **Test connection**.
 4. Under **Free on-device translation**, click **Check & download language pack** to fetch the small Danish pack once. Until then, translations stay marked *pending*.
-

02 Capturing with the extension

- **Save a word:** select Danish text on any page → right-click → **Save “...” to Rødspætte** (or press `Alt+Shift+D`). A card appears with an automatic translation and dictionary data — choose a set and Save.
- **Sets:** pick the active set, or create a new one, from the toolbar popup.
- **Highlight known words:** popup → Highlight known words. Grant all-sites access once; `Alt+Shift+H` toggles it. Click any highlighted word to add or edit its translation inline.
- **PDFs:** popup → Open a PDF in the reader. Web PDFs open automatically after you approve the site; local PDFs you pick once. Select text to capture it — the reader is for reading, so known-word highlighting stays off here.
- **Ambiguous words:** when ordnet.dk lists several senses, the popup shows **Pick senses** so you choose the right one.
- **Auto-pilot:** while Chrome is open, every 15 minutes Rødspætte files any phone captures and enriches rows still marked *pending*. **Process inbox & pending** runs the same pass on demand.

03 Deploy the quiz app on GitHub Pages

1. Create a second, **public** repository (for example `rodspaette-app`). Pages is free on public repos, and the app contains no secrets — your token and words never live in it.
2. In that repo, choose **Add file** → **Upload files** and drag in the contents of the `quiz-app/` folder, then Commit.
3. Go to **Settings** → **Pages** → **Deploy from a branch**, pick branch `main`, folder `/` (root), and Save. After about a minute the app is live at `https://USERNAME.github.io/REPO/`.
4. Open that URL and paste the same token, plus your owner, your vocab repo name, and folder (`sets`). Click **Connect**.

04 Install on iPhone *(optional)*

Open the Pages URL in Safari → **Share** → **Add to Home Screen**. It launches fullscreen like a native app, caches itself for offline study, and asks for the token once. No App Store, no Mac, no developer account.

05 Studying

- The decks screen lists every set with due / new / total counts, plus an **Alle sæt** deck that combines everything.
- Tap a deck → cards show Danish-side first; tap to flip. Grade **Again** / **Hard** / **Good** / **Easy** — each button shows when you'd next see the card. On desktop, Space flips and keys 1–4 grade.
- The direction chip cycles **DA** → **EN** → **EN** → **DA** → **DA ⇄ EN**; the selector sets how many new cards enter per session.
- Scheduling uses **FSRS**, the modern successor to SM-2: every answer updates the card's memory stability and difficulty, reviews land where predicted recall hits 90%, and each answer is logged to a hidden ReviewLog sheet in your Excel files for future personal tuning.

- **+ Add** saves a word you just heard — it lands as *pending* and your computer fills in the dictionary data on its next pass. **Inspect** browses, edits, or deletes cards. Every grade and edit syncs back into the Excel files.
- **Moving a card to another deck:** open the card (Inspect, or  during a session) and pick a new **Deck** in the editor — or tap the ⇌ button on any Inspect row for a one-tap move. The whole row and its review schedule travel to the other deck's Excel file on the next sync.
- **Numbered files, one deck:** when a set has rolled over (*Nyheder*, *Nyheder-2*, *Nyheder-3...*), every screen still shows a single **Nyheder** deck — small spots under the name count its files. A meter appears under the deck when the newest file passes 95 %.

06 Capture from your iPhone with a Shortcut *(optional)*

Save Danish text from any iPhone app — and pick which deck it lands in. The Shortcut fetches your live set list, asks you to choose, and drops a file into an `inbox/` folder in your vocab repo; the extension files and enriches it on its next auto-pilot pass. In the Shortcuts app, create a shortcut named **Gem dansk ord** and:

1. Turn on **Show in Share Sheet** (input type: Text). Set *If there's no input* → **Ask For** → **Text**, so the Home-Screen icon also lets you type a word.
2. **Get Contents of URL:** Method GET, URL
<https://api.github.com/repos/USER/REPO/contents/sets/index.json>; headers Authorization: Bearer <token> and Accept: application/vnd.github.raw. This returns your deck list, e.g. `["Nyheder", "Arbejde", "Hverdag"]` — the extension keeps this file up to date for you.
3. **Choose from List** (List: Contents of URL) — pick the deck for this word.
4. **Text:** `{"term":"[Shortcut Input]","set":"[Chosen Item]"}` (you can add "note" too) → **Base64 Encode** the Text.
5. **Format Date:** Current Date, custom format `yyyyMMdd-HH:mm:ss`.
6. **Get Contents of URL:** Method PUT, URL
[https://api.github.com/repos/USER/REPO/contents/inbox/\[Formatted Date\].txt](https://api.github.com/repos/USER/REPO/contents/inbox/[Formatted Date].txt); same Authorization header plus Accept: `application/vnd.github+json`; JSON body with message and content (the Base64 value).

7. Optionally add **Add to Home Screen** for quick type-in capture. A chosen deck is honored only if it already exists — typos can't spawn files — and words land in the deck's newest numbered file automatically. If `index.json` doesn't exist yet, open the extension popup and hit `U` once.
-

* Good to know

- **Token safety:** it's entered on each device and stored only in that browser; it's only ever sent to `api.github.com`. If a device is lost, revoke the token on GitHub and issue a new one.
 - **Excel is the source of truth.** Edit a translation in the app, the reader, or on GitHub, hit Refresh, and the cards update.
 - **Full sets roll over by themselves.** GitHub's contents API only serves files up to 1 MB, so a set counts as *full* at 880 KB. You're warned at 95 %, and the first word past full opens the next numbered file (`Nyheder-2.x1sx`) automatically — no words are ever refused, and the numbered files always read back as one deck.
 - **Offline:** the app studies from its cache and uploads your progress the moment you're back online.
 - **Updating later:** replace the extension folder and press Reload on its card; for the app, re-upload the changed files — Pages redeploys, and the PWA picks up updates on its next launch.
