

Rødspætte 1.0

Installation & setup guide

A private Danish-vocabulary system in two parts: a **Chrome extension** that captures words as you read and enriches them with ordnet.dk data and on-device translation, and an installable **quiz app** that studies them with spaced repetition. Both read and write the same Excel files in your own private GitHub repository — that repo is the single source of truth, and nothing is sent anywhere else.

What's in the package

- **extension/** — the Chrome extension (word capture, ordnet.dk lookups, free on-device translation, a known-words highlighter, and a built-in PDF reader).
- **quiz-app/** — the installable flashcard app (FSRS spaced repetition), hosted for free on GitHub Pages.
- **LICENSE**, and this guide.

Before you start

- A **GitHub account**.
- A **private repository** to hold your vocabulary (for example dansk-vokab). The extension keeps your sets in a `sets/` folder inside it, creating the folder on first save.
- A **fine-grained personal access token** with **Contents: Read and write** on that one repository (GitHub → Settings → Developer settings → Personal access tokens → Fine-grained tokens). The same token works for both parts.
- **Chrome 138 or newer** on desktop, for the free built-in translator (optional, but recommended).

Part 1 — Install the Chrome extension

- 1 Open `chrome://extensions` and turn on **Developer mode** (top-right).
- 2 Click **Load unpacked** and select the **extension/** folder. The card should read **Rødspætte 1.0.0**. Pin it for easy access.
- 3 Open the extension's **Options** (right-click the icon → Options, or the Options link in the popup). Enter your **token**, **owner** (your username), **repo**, and **folder** (`sets`). Click **Save settings**, then **Test connection**.
- 4 Still in Options, under **Free on-device translation**, click **Check & download language pack** to fetch the small Danish pack once. Until it's downloaded, translations stay marked *pending*.

Part 2 — Capturing with the extension

- **Save a word:** select Danish text on any page → right-click → **Save “...” to Rødspætte** (or press **Alt+Shift+D**). A card appears with an automatic translation and dictionary data — choose a set and **Save**.
- **Sets:** pick the active set, or create a new one, from the toolbar popup.
- **Highlight known words:** popup → **Highlight known words**. Grant all-sites access once and it stays on across pages; **Alt+Shift+H** toggles it. Click any highlighted word to add or edit its translation inline.
- **PDFs:** popup → **Open a PDF in the reader**. Web PDFs open automatically after you approve the site; local PDFs you pick once. Capture and highlighting both work there.

- **Ambiguous words:** when ordnet.dk lists several senses, the popup shows **Pick senses** so you choose the right one.
- **Auto-pilot:** while Chrome is open, every 15 minutes Rødspætte files any phone captures and enriches rows still marked *pending*. **Process inbox & pending** runs the same pass on demand.

Part 3 — Deploy the quiz app (GitHub Pages)

- 1 Create a **second, public** repository (for example `rodspaette-app`). Pages is free on public repos, and the app contains no secrets — your token and words never live in it.
- 2 In that repo, choose **Add file** → **Upload files** and drag in the contents of the **quiz-app/** folder, then **Commit**.
- 3 Go to **Settings** → **Pages** → **Deploy from a branch**, pick branch **main**, folder **/ (root)**, and **Save**. After about a minute the app is live at `https://USERNAME.github.io/REPO/`.
- 4 Open that URL and paste the **same token**, plus your **owner**, your **vocab repo** name, and folder (sets). Click **Connect**.

Part 4 — Install on iPhone (optional)

Open the Pages URL in **Safari** → **Share** → **Add to Home Screen**. It launches fullscreen like a native app, caches itself for offline study, and asks for the token once. No App Store, no Mac, no developer account.

Part 5 — Studying

- The decks screen lists every set with **due / new / total** counts, plus an **Alle sæt** deck that combines everything.
- Tap a deck → cards show Danish-side first; **tap to flip**. Grade **Again / Hard / Good / Easy** — each button shows when you'd next see the card. On desktop, **Space** flips and keys **1–4** grade.
- The direction chip cycles **DA**→**EN** → **EN**→**DA** → **DA**■**EN**; the selector sets how many new cards enter per session.
- Scheduling uses **FSRS**, the modern successor to SM-2: every answer updates the card's memory *stability* and *difficulty*, reviews land where predicted recall hits 90%, and each answer is logged to a hidden ReviewLog sheet in your Excel files for future personal tuning.
- ■ **Add** a word you just heard — it saves as *pending* and your computer fills in the dictionary data on its next pass. ■ **Inspect** browses, edits, or deletes cards. Every grade and edit syncs back into the Excel files.

Part 6 — Capture from your iPhone with a Shortcut (optional)

This lets you save Danish text from any iPhone app. It drops a file into an `inbox/` folder in your vocab repo; the extension files and enriches it on its next auto-pilot pass. In the **Shortcuts** app, create a shortcut named **Gem dansk ord** and:

- 1 Turn on **Show in Share Sheet** (input type: Text). Set **If there's no input** → **Ask For** → **Text** (so the Home-Screen icon also lets you type a word).
- 2 **Get Text from Shortcut Input** → **Base64 Encode** it.
- 3 **Format Date:** Current Date, custom format `yyyyMMdd-HH:mm:ss`.
- 4 **Get Contents of URL:** Method **PUT**, URL `https://api.github.com/repos/USER/REPO/contents/inbox/[Formatted Date].txt`; headers `Authorization: Bearer <token>` and `Accept: application/vnd.github+json`; JSON body with message and content (the Base64 value).

- 5 Optionally add **Add to Home Screen** for quick type-in capture. A payload may also be JSON — e.g. `{"term":"pålæg","note":"heard at lunch","set":"Arbejde"}` — and a named set is honored only if it already exists.

Good to know

- **Token safety:** it's entered on each device and stored only in that browser; it's only ever sent to `api.github.com`. If a device is lost, revoke the token on GitHub and issue a new one.
- **Excel is the source of truth.** Edit a translation in the app, the reader, or on GitHub, hit Refresh, and the cards update.
- **1 MB limit:** GitHub's contents API only serves files up to 1 MB; Rødspætte refuses to overwrite a set it can't fully read, rather than risk wiping it. Keep individual sets reasonably sized.
- **Offline:** the app studies from its cache and uploads your progress the moment you're back online.
- **Updating later:** replace the extension folder and press Reload on its card; for the app, re-upload the changed files (Pages redeploys, and the PWA picks up updates on its next launch).

Rødspætte 1.0 — rød spætte, the red plaice. Consolidated from the Dansk Vokab extension and quiz app. Your vocabulary lives in your private repository; this package is only code.
